

## Editorial

In the second issue, The Mega Journal has opened a new avenue in which the researchers are concentrated on different teaching tools in the classroom. Besides teaching tools, researchers have formulated different horizons of knowledge. It has established a standard as a peer-reviewed journal that allows it to present innovative reading and analysis from an interdisciplinary perspective.

The world is facing complex and pressing challenges that require a multi-disciplinary approach to find solutions. Social sciences, with their focus on human behavior, culture, and societal structures, play a critical role in this endeavor. Social sciences can provide insights into the intellectual elements that drive and are affected by these challenges, from poverty and inequality to climate change and political instability.

One of the unique strengths of social sciences is their ability to understand and analyze the social and cultural context in which problems arise. This includes examining power structures, biases, and attitudes that shape the way individuals and communities experience and respond to challenges. By taking these factors into consideration, social sciences can help design solutions that are culturally sensitive, equitable, and effective.

Likewise, this issue also deals with the evidence-based management that encourage managers to make decisions based on objective data, rather than subjective opinions. This can lead to more accurate decision-making and reduce the risk of making mistakes based on biases or incomplete information. In addition, evidence-based management can help managers stay current on best practices and industry trends, allowing them to continuously improve their operations and stay ahead of the competition.
